Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C.§103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 1. Claims 10-13 are rejected under 35 U.S.C. §103(a) as being unpatentable over Smolley (US 4,581,679) and Higgins III (US 5,117,069) in further view of Boegh-Petersen (US 4,707,657).

With respect to claim 10; Smolley shows an arrangement of stacked circuit boards (Fig. 3), comprising: arranging at least two circuit boards 10, 12 having a pair of opposing circuit board terminals 14 and a first retainer board 16 having at least one hole 18 into which a wire button contact 20 is inserted, the wire button contact 20 providing electrical connection between the pair of opposing circuit board terminals 14 of the two circuit boards 10, 12.

However Smolley does not show the hole being plated and at least one conductor connected to the hole.

Higgins III shows an arrangement of stacked circuit boards (Fig. 1) having at least one plated hole 111 and at least one conductor 128 connected to the hole.

However neither Smolley nor Higgins III show a method of testing an arrangement of stacked circuit boards.

Boegh-Petersen shows an arrangement of stacked circuit boards (Figs. 1-6) employing a method for producing and testing such an arrangement (Col. 2, lines 25-54).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made that plating the through hole of Smolley as taught by Higgins III would

provide for redundant assurance of connectivity between the printed circuit boards while also permitting external access to the through hole by way of a conductor. All of which would serve to easily test the circuit boards for electrical integrity that is not otherwise validated through visual inspection as taught by Boegh-Petersen, thus being able to ascertain acceptability of the printed circuit board components prior to their final assembly; thus saving time, money and producing a more reliable product in having electrically inspected the printed circuit boards.

With respect to claim 11; Smolley shows fixedly assembling the printed circuit board arrangement (Col. 6, lines 5-21).

With respect to claim 12; Smolley shows it is well-known through the prior art as an example that the retainer board 16 is a multilayer board (Col 2, lines 15-18) wherein dielectric layers constitute the outer layers (Col. 1, lines 50-55) of a mid section of the multilayer retainer board.

With respect to claim 13; Smolley shows inserting a second retainer board 32 which is substantially identical to the first retainer board (Fig. 3).

2. Claims 14 and 15 are rejected under 35 U.S.C. §103(a) as being unpatentable over Smolley (US 4,581,679) In view of Higgins III (US 5,117,069).

With respect to claim 14; Smolley shows at least two circuit boards 10, 12 having a pair of opposing substrate terminals 14, a first retainer board 16 having at least one hole 18 into which a wire button contact 20 is inserted, the wire button contact 20 providing electrical connection between the pair of opposing circuit board terminals 14 of the two circuit boards 10, 12.

However Smolley does not show the hole being plated and at least one conductor connected to the hole.

Higgins III shows an arrangement of stacked circuit boards (Fig. 1) having at least one plated hole 111 and at least one conductor 128 connected to the hole.

Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made that plating the through hole of Smolley as taught by Higgins III would provide for redundant assurance of connectivity between the printed circuit boards while also permitting external access to the through hole by way of a conductor enabling the ability to ascertain acceptability of the printed circuit board components prior to their final assembly; thus saving time, money and producing a more reliable product in having electrically inspected the printed circuit boards.

With respect to claim 15; Smolley shows the retainer board 16 is a multilayer board (Col. 2, lines 15-18) wherein dielectric layers constitute the outer layers (Col. 1, lines 50-55) of a mid section of the multilayer retainer board.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Vanessa Girardi: Telephone number (571) 272-5924.

Monday - Thursday 7 a.m. to 5:30 p.m. (EST)

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Paula Bradley can be reached on (571) 272-2800 ext 33.

The fax phone number for the organization where this application or proceeding is assigned is (571) 273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
